Reflection

This activity gave me hands-on experience in building a full-stack web application using the MEAN Stack MongoDB, Express.js, Angular, and Node.js. Before this, I only had a theoretical understanding of how these technologies work together, but actually going through the entire development process made everything much clearer and more meaningful.

Setting up the backend using Express.js and connecting it to MongoDB was initially intimidating, but once I understood how MongoClient and ObjectId work, it became manageable. I learned how critical it is to properly structure HTTP methods GET, POST, PUT, and DELETE to perform CRUD operations efficiently. I also realized how important CORS configuration is when the frontend and backend are running on different ports.

On the frontend side, working with Angular 19 introduced me to its newer standalone component architecture, two-way data binding using ngModel, and HttpClient for API communication. One of the biggest challenges I faced was the change in file naming conventions between older and newer Angular versions, where app.component.ts was replaced by app.ts. This caused several errors that took time to debug and resolve.

Beyond the basic requirements, I added two extra fields Email Address and Contact Number to make the application more realistic. I also implemented a fully working Edit function that pre-fills the modal form with the selected student's existing data, making updates seamless for the user. Formatting the interface using custom CSS gave the application a cleaner and more professional look.

Overall, this activity deepened my understanding of how data flows from the user interface through the API and into the database. It was challenging, frustrating at times, but ultimately rewarding. Completing a working full-stack CRUD application from scratch gave me the confidence to tackle more complex web development projects in the future.
