Reflection:

This activity gave me hands-on experience in building a full-stack web application using the MEAN Stack MongoDB, Express.js, Angular, and Node.js. Before this, I only had a theoretical understanding of how these technologies work together, but actually implementing them made the concepts much clearer.

Setting up the backend using Express.js and connecting it to MongoDB was straightforward once I understood how the MongoClient and ObjectId work. I learned how important it is to properly handle HTTP methods — GET, POST, PUT, and DELETE — to perform CRUD operations on the database.

On the frontend side, working with Angular 19 taught me how to use standalone components, two-way data binding with ngModel, and HttpClient to communicate with the REST API. One challenge I encountered was the difference in file naming conventions

between older and newer versions of Angular, where app.component.ts became app.ts in Angular 19.

I also added two additional fields Email Address and Contact Number beyond the basic requirements, and implemented an Edit function that pre-fills the form with existing student data. Styling the interface using custom CSS made the application look more professional and user-friendly.

Overall, this activity strengthened my understanding of how the frontend and backend communicate through APIs, and how data flows from the user interface all the way to the database. It was challenging at times, especially debugging connection errors and fixing the edit function, but completing it gave me confidence in building full-stack applications.
